

Go-to-Market (GTM) Engineer

Where revenue meets engineering: build the systems that scale sales

Company	MONA AI GmbH — applied AI agents for enterprise
Location	Saarbrücken / remote (EU time zones)
Team	Revenue · works across Sales, Marketing & Product
Type	Full-time, permanent

About the role

A hybrid technical-commercial role. You'll automate the GTM motion end-to-end: enrich and route leads, build outbound and lifecycle workflows, wire the data between CRM and product, and ship internal tools (often AI-assisted) that make the revenue team faster.

What you'll do

- Design and maintain lead enrichment, scoring and routing pipelines.
- Build outbound/lifecycle automations and integrations across CRM, product and billing data.
- Develop internal tools and lightweight apps (incl. LLM-powered workflows) for sales & CS.
- Instrument the funnel: event tracking, attribution, and revenue dashboards.
- Run experiments on messaging, sequencing and conversion; report what actually moves pipeline.

Must-have qualifications

- 2+ years in GTM/RevOps/sales-engineering or software engineering touching go-to-market.
- Strong with APIs, webhooks and scripting (Python or JavaScript/TypeScript).
- Hands-on CRM automation (HubSpot or Salesforce) and data plumbing (SQL).
- Comfortable building with LLM APIs and prompt-based workflows.
- Clear communicator who can sit between technical and commercial teams.

Nice to have

- Experience with iPaaS / workflow tools (Zapier, Make, n8n) and reverse-ETL.
- Familiarity with product-led growth instrumentation and attribution modelling.
- Prior startup 0→1 GTM tooling experience.

Tools & stack

Python / TypeScript · HubSpot or Salesforce · SQL & warehouse (BigQuery/Postgres) · REST/webhooks · LLM APIs · n8n/Make/Zapier · analytics (e.g. Looker/Metabase).

What success looks like (first 6 months)

Lead routing and enrichment fully automated; a working revenue dashboard the team trusts; at least two shipped internal tools that measurably cut manual sales work.

For the agent: Ask them to walk through a real automation they built end-to-end (data in → action out), how they handle API rate limits/failures, and how they measure GTM impact. Red flags: can't explain a pipeline they built, or conflates 'ran a tool' with 'engineered a system'.
